### **ABSTRACT**

This report is based on the project we have done, which is called Inventory Management Software. This is developed mostly based on the trending NoSQL solution MongoDB. The main use of the above mentioned software is for the retailers who want to manage their product stocks among their various branches. The project is with a well understandable user interface with well formed security. The total code for this project can be found <a href="here">here</a>. Since the NoSQL solution is MongoDB we can say that our software is able to manage heavy data efficiently. Presently for the demo purpose we have initiated the software with 1k rows of data. With our software the stock manager can check for the products in the company's godown as well as insert, delete, update the products. We also have employed a chat feature for the go down manager and branch manager. Branch office has a separate module which is used for checking the product data present in the branch. This module also has the ability to insert, update the stock present in the branch.

### **INTRODUCTION**

We know how the food and grocery market in India is rising day-by-day. Analysis says that by 2024, this market will reach \$790. In a gap of 7 years, from 2013 to 2019 this market doubled from \$300 to \$600. There are alot of companies running behind this like D-Mart, Reliance Fresh, Big Bazar etc. and there is no need to talk about the online market because you see that every half yearly an app is getting released.

You can't imagine the amount of data released every day due to this. Each day, millions of transactions happen and companies need to record everything. For suppose consider a company like D-Mart, every day it gets its stocks from its go down, records it every time. While, go down, update it every time and insert product data when it gets the specific product from the company. They also maintain separate databases for the products in the branch because they alone can count to thousands. This huge data cannot be handled by traditional relational databases and this is why we need to shift to a more optimal solution called a NoSQL database.

### 1.1 Objectives

The following are the objectives of this project:

- Creating a web application to provide effective assistance to product stock managers of grocery or market companies.
- Effective solution for handling tons of data using NoSQL database MongoDB.
- Wide variety of features like inserting, deleting, updating and searching the available data.
- Easy to use and interactive UI.
- A communication portal for interaction between the company and branch managers.

## 1.2 Background and Literature Survey

The India online grocery market size was valued at USD 2.9 billion in 2020 and is expected to expand at a compound annual growth rate (CAGR) of 37.1% from 2021 to 2028. The market has gained immense traction over the past months on account of the changing lifestyle of the consumers, growing urbanization, and the tech-savvy generation who prefers buying products online.

This project formed on the basis of problems like the ever increasing data in grocery and market industry and traditional databases are not well in managing this and this can cause huge computational costs. We need a simple and effective solution for this problem and the solution is NoSQL database. This can manage the tonnes of data easily. Analysis can also be done with very less computational cost.

### 1.3 Organization of the Report

The remaining chapters of the project report are described as follows:

- Chapter 2 contains the proposed system, methodology and software details.
- Chapter 3 gives the cost involved in the implementation of the project.
- Chapter 4 discusses the results obtained after the project was implemented.
- Chapter 5 concludes the report.
- Chapter 6 consists of codes.
- Chapter 7 gives references.

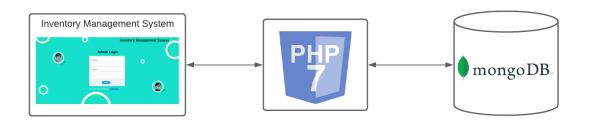

### **INVENTORY MANAGEMENT SYSTEM**

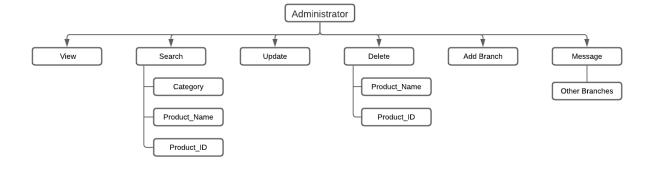

This Chapter describes the proposed system, working methodology and software details.

## 2.1 Proposed System

The following block diagram shows the system architecture of this project.

**Basic Architecture: IMS** 

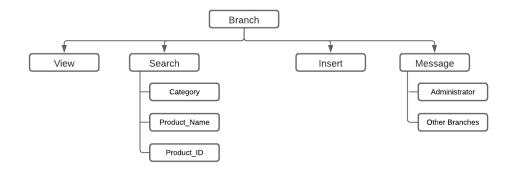

Figure 1. System Architecture Diagram

### 2.2 Working Methodology

The project is completely based on software with two sections, front-end and back-end. The front-end consists of a Bootstrap4 file. It has been hosted on Heroku (powered by Salesforce). The back-end is built using PHP-Composer. With a database as MongoDB atlas.

This application is used to show the stock details. It gives the details with search options by Category, by Product ID, or by Product Name. The details components are described below:

**Admin Login page:** As application starts the login page appears. Admin login is determined by the username and password that has all the authority to send message, search, add, update and delete the stock of the organization as per the requirement.

**Create Branch**: Admin can create a branch if he/she needs to extend or manage their product and shops easily. He can create the account of the branch along with Branch Name, Branch ID, Password and Address. Later he can share credentials to the Branch Manager to handover.

**Branch Login page**: This page is exclusively for branch manager login. The branch manager can send messages to other branches or the admin about the stocks and update them about his.her branch status, also the branch manager can search or insert products to the database.

### 2.3 Software Details

Front End	Bootstrap4
Back End	PHP - Composer (PHP v7)
Database	MongoDB Atlas
Server	Heroku

#### DATABASE ANALYSIS

#### 3.1 **Datasets and attributes**

We have used a cloud database - MongoDB Atlas free tier cluster.

In the document model of MongoDB Atlas, data becomes like code in the form of JSON documents. Developers, not DBAs, shape the data and easily map it to application objects, accelerating time to market.

The data consists of 8000 Product Details. With the following attributes.

#### \_id: ObjectId("60af9c1bd0e6f1f0dbb6be85")

Order ID: "CA-2017-152156" Ship Date: "11/11/2017" Ship Mode: "Second Class" Quantity: "42420"

Product ID: "FUR-BO-10001798"

Category: "Furniture" Sub-Category: "Bookcases"

Product Name: "Bush Somerset Collection Bookcase"

Price: "261.96"

#### Other Schema

#### Product data

DATABASE SIZE: 280.9KB INDEX SIZE: 80KB TOTAL COLLECTIONS: 2

CREATE COLLECTION

CREATE COLLECTION

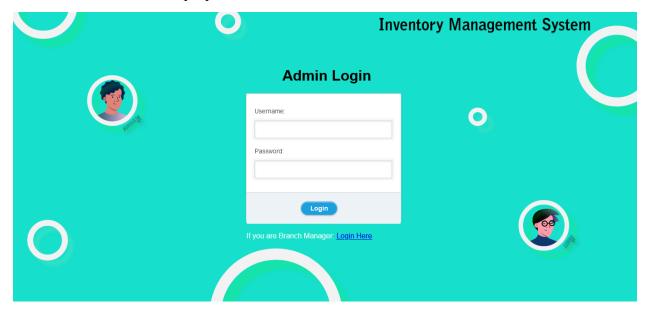

Collection Name	Documents	Documents Size	Documents Avg	Indexes	Index Size	Index Avg
Branch_details	3	443B	148B	1	36KB	36KB
Godown_stock	1000	280.47KB	288B	1	44KB	44KB

#### Company Chat

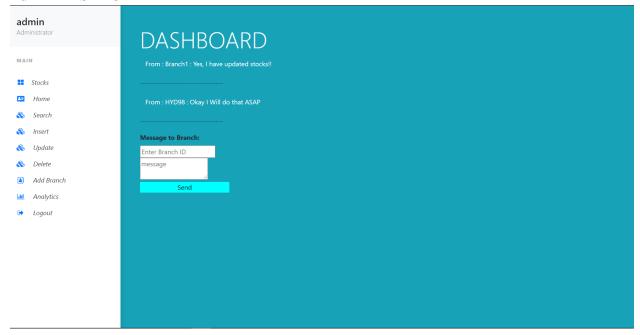

DATABASE SIZE: 363B INDEX SIZE: 76KB TOTAL COLLECTIONS: 3 Collection Name Documents Documents Size Documents Avg Indexes Index Size Index Avg Branch1 93B 93B 1 20KB 20KB HYD98 112B 112B 20KB 20KB admin 2 158B 79B 36KB 36KB

### **RESULTS AND DISCUSSIONS**

The application consists of two roles - admin and branch manager respectively. Both the roles have different access properties.

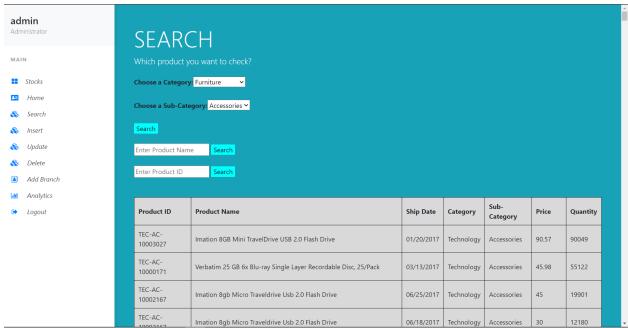

### Admin DASHBOARD

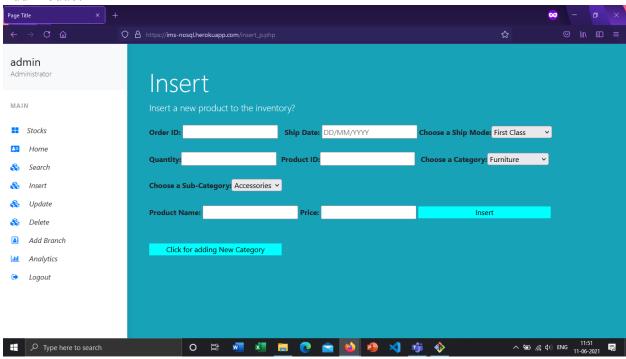

#### View Stocks

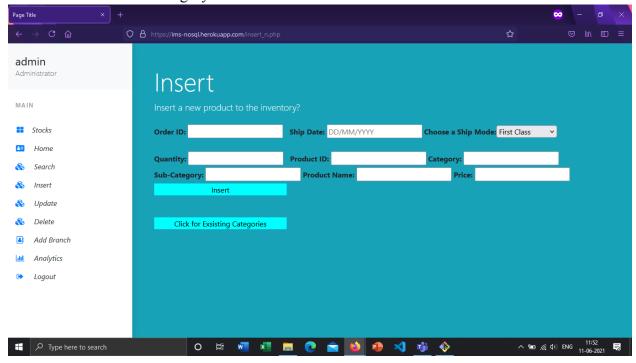

#### Search Stocks

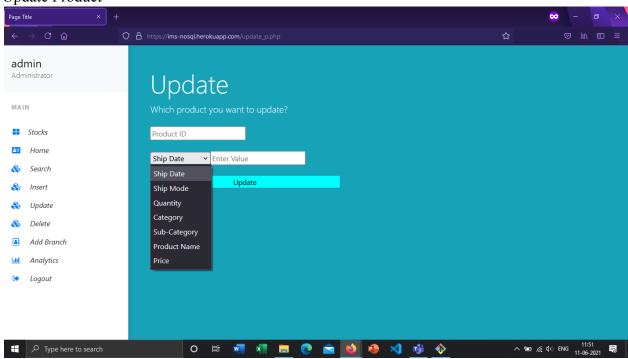

#### Add Product

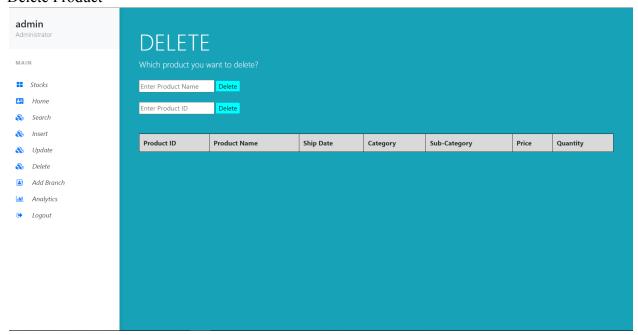

### Add Product with new category

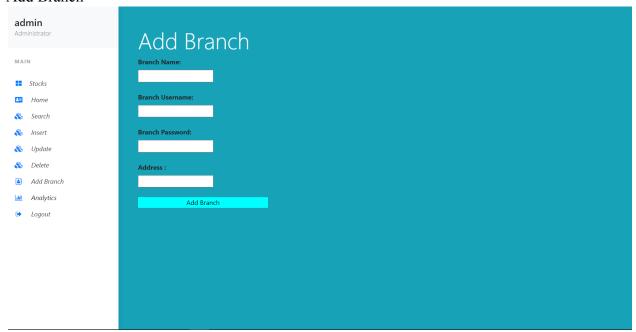

**Update Product** 

#### **Delete Product**

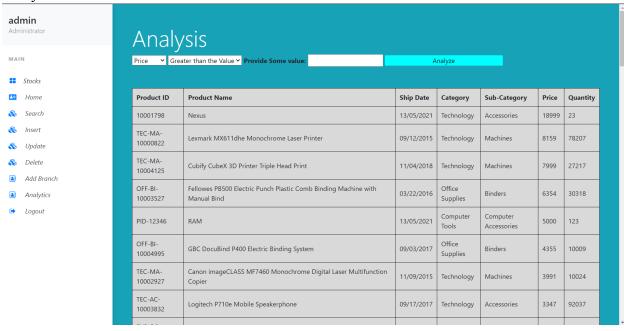

### Add Branch

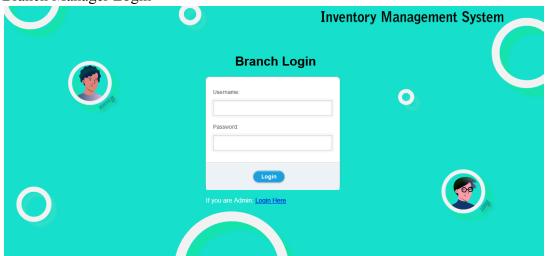

### **Analytics Page**

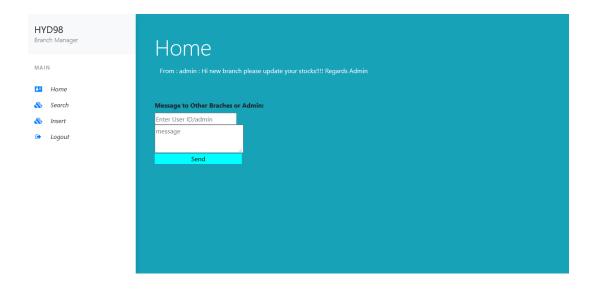

**Analytics Continue** 

Branch Manager Login

Branch DASHBOARD [Search and insert are same as admin page]

Project Link: <a href="https://ims-nosql.herokuapp.com/index.php">https://ims-nosql.herokuapp.com/index.php</a>

#### **CHAPTER 5**

#### CONCLUSION AND FUTURE WORK

This project helps people to record huge amounts of data easily and manage them perfectly. Each and every feature helps the manager to its maximum extent. Compared to traditional databases, NoSQL databases are easy to implement and operate.

This field has many future developments and it can include many features. Some of them are listed below

- Creating a module which is a direct implementation of sending stocks to the branches. For suppose, Branch requested for a certain amount of stocks then this module takes input of that data from admin and then does updation from Main Go\_down, insertion in branch.
- Branch can have another module for recording the customer transactions.
- Analytics module which can show the transactions in the form of graphs.

### **APPENDIX**

Connection to MongoDB

```
<?php
require_once __DIR__ . '/mongo/vendor/autoload.php';
$con = new MongoDB\Client("mongodb://localhost:27017");
?>
```

#### Inserting a product - insert p.php

```
<?php
      //Connecting MongoDB and to database and collection
       include 'dbconnect.php';
       $db = $con->Product data;
       $collection = $db->Godown stock;
       if(!empty($ POST['orderid'])){
       $orderid = $ POST['orderid'];
       $shipdate = $ POST['shipdate'];
       $shipmode = $ POST['shipmode'];
       $quantity = $_POST['quantity'];
       $productid = $ POST['productid'];
       $categories = $ POST['categories'];
       $SubCategory = $_POST['SubCategory'];
       $pname = $ POST['pname'];
       $price = $ POST['price'];
       $insertOneResult = $collection->insertOne([
       'Order ID' => $orderid,
       'Ship Date' => $shipdate,
       'Ship Mode' => $shipmode,
       'Quantity' => $quantity,
       'Product ID' => $productid,
       'Ship Mode' => $shipmode,
       'Category' => $categories,
       'Sub-Category' => $SubCategory,
       'Product Name' => $pname,
       'Price' => $price,
       ]);
```

```
echo "<script>alert('Inserted Data');</script>";
    printf("Inserted %d document(s)\n", $insertOneResult->getInsertedCount());

}

if(empty($_POST['pid'])){
    $pid=";
}

?>
```

### Update stock - update\_p.php

```
<?php
      include 'dbconnect.php';
      $db = $con->Product data;
      $collection = $db->Godown stock;
      if(!empty($ POST['pid'])){
      $pid=$ POST["pid"];
      $pname=$ POST["pname"];
      $cat =$ POST["cat"];
      // $scat=$ POST["scat"];
      // $price=$ POST["price"];
      // $qnt=$ POST["qnt"];
      $cursor = $collection->updateOne(['Product ID'=> $pid],['$set'=>['Product
Name'=>$pname,'Category'=>$cat]]);
      foreach($cursor as $document){
      echo"";
      echo"".$document["Product ID"]."";
      echo"".$document["Product Name"]."";
      echo"".$document["Ship Date"]."";
      echo"".$document["Category"]."";
      echo"".$document["Sub-Category"]."";
      echo"".$document["Price"]."";
```

```
echo"".$document["Quantity"]."";
echo"";
}

if(empty($_POST['pid'])){
    $pid=";
}

// $pass=$_POST["tf2"];
// $Query = array('Product ID' => $pid);

//iterator

?>
```

### Search - search\_p.php

```
<?php
 //Connecting MongoDB and to database and coolection
 include 'dbconnect.php';
 $db = $con->Product data;
 $collection = $db->Godown stock;
 //iterator category
 $cursor = $collection->distinct('Category');
 echo"<label for='categories'>Choose a Category:</label>";
 echo"<select name='categories' id='category'>";
 foreach($cursor as $document){
       echo"<option value='$document'>$document</option>";
 echo"</select><br>";
 //iterator sub - category
 $cursor = $collection->distinct('Sub-Category');
echo"<label for='SubCategory'>Choose a Sub-Category:</label>";
 echo"<select name='SubCategory' id='subcategory'>";
 foreach($cursor as $document){
       echo"<option value='$document'>$document</option>";
```

```
echo"</select><br>";
?>
<input type="submit" value="Search" class="search-p1"><br><br>
</form>
</form>
<form action="search p.php" method="post">
<input type="text" name="pname" placeholder="Enter Product Name">
<input type="submit" value="Search" class="search-p1"><br>><Br>
</form>
<form action="search p.php" method="post">
<input type="text" name="pid" placeholder="Enter Product ID">
<input type="submit" value="Search" class="search-p1">
</form>
      </div><br><br>>
      Product ID
      Product Name
      Ship Date
      Category
      Sub-Category
      Price
      Quantity
      <?php
      if(!empty($ POST['categories']) or !empty($ POST['SubCategory'])){
      $cat = $ POST["categories"];
      $sub = $ POST["SubCategory"];
      //iterator
      $cursor = $collection->find(['Category' => $cat, 'Sub-Category' => $sub,]);
      foreach($cursor as $document){
      echo"";
      echo"".$document["Product ID"]."";
```

```
echo"".$document["Product Name"]."";
     echo"".$document["Ship Date"]."";
      echo"".$document["Category"]."";
      echo"".$document["Sub-Category"]."";
      echo"".$document["Price"]."";
      echo"".$document["Quantity"]."";
      echo"";
 if(!empty($ POST['pname'])){
      $pname = $ POST["pname"];
     //iterator
      $cursor = $collection->find(['Product Name' => $pname,]);
     foreach($cursor as $document){
     echo"";
     echo"".$document["Product ID"]."";
     echo"".$document["Product Name"]."";
      echo"".$document["Ship Date"]."";
     echo"".$document["Category"]."";
      echo"".$document["Sub-Category"]."";
     echo"".$document["Price"]."";
      echo"".$document["Quantity"]."";
     echo"";
}
if(!empty($ POST['pid'])){
$pid = $ POST["pid"];
//iterator
$cursor = $collection->find(['Product ID' => $pid,]);
foreach($cursor as $document){
echo"";
echo"".$document["Product ID"]."";
echo"".$document["Product Name"]."";
echo"".$document["Ship Date"]."";
echo"".$document["Category"]."";
echo"".$document["Sub-Category"]."";
echo"".$document["Price"]."";
```

```
echo"".$document["Quantity"]."";
echo"";
}
}
?>
```

### Delete - delete p.php

```
<?php
       include 'dbconnect.php';
       $db = $con->Product data;
       $collection = $db->Godown stock;
 if(!empty($ POST['pname'])){
       $pname = $ POST["pname"];
       //iterator
       $cursor = $collection->deleteOne(['Product Name' => $pname,]);
echo "<script>alert('Deleted Data');</script>";
printf("Inserted %d document(s)\n", $cursor->getDeletedCount());
}
else if(!empty($_POST['pid'])){
 $pid = $ POST["pid"];
//iterator
$cursor = $collection->deleteOne(['Product ID' => $pid,]);
echo "<script>alert('Deleted Data');</script>";
printf("Deleted %d document(s)\n", $cursor->getDeletedCount());
?>
```
